BASTRA-smoking systems and the new 1200 HE !

Innovative technology — maximum safety.

NEW BASTRA SMOKE GENERATORS

For our INDUSTRIAL LINE range of products, we are presenting a number of innovations at the IFFA including two new wood chip smoke generators. The models 1200 HS and 1200 HE were developed especially for **BASTRA** multi-trolley hot and cold smoking systems with 4 to 12 trolleys as well as for climatic maturing smoking systems with a capacity of up to 40 trolleys.

We fulfil the strict safety requirements for smoking systems by integrated extinguishing or fire protection equipment for the supply tank and the glowing zone, for example. To prevent the wood chips sliding into the system uncontrolled, the opening of the supply tank to the glowing chamber will be automatically closed (supply tank has a capacity of around 400 litres / around 120 kg). The electric heating rod of the ignition system is under the glowing plate and is thus protected from mechanical load. Electric ignition and ignition rod monitoring are carried out by the system control. The clearance height allows the floor under the smoke generator to be cleaned easily. Smoke tube cleaning is carried out automatically every time the chamber is cleaned.

Model 1200 HE with significantly extended functions also has a viewing window for the smouldering chamber and the supply tank. This facilitates the safe optical monitoring of both glow and filling level. Another special feature of the HE version we have to offer you is the additional possibility of producing either diluted or humidified smoke. You can set three different smoke densities and select these with the system running, so that the optimum smoke density can be found for the product. The density can also be assigned to the respective program at any time. If necessary, you can clean the smoke generator every time the chamber is cleaned.
